

Overview

Method Name
Insulin-I125 binding capacity

NY State Available
Yes

Specimen

Specimen Type
Serum

Specimen Required
Patient preparation: No radioactive isotopes should be administered 24 hours prior to venipuncture.
Collection Container/Tube:
Preferred: Serum gel
Acceptable: Red top
Submission Container/tube: Plastic vial
Specimen Volume: 0.5 mL
Collection Instructions:
1. Within 24 hours of collection, centrifuge and aliquot 0.5 mL of serum into a plastic vial.
2. Freeze immediately after separation and send frozen.

Specimen Minimum Volume
0.2 mL Note: This volume does not permit repeat analysis.

Reject Due To

Thawing**	Cold Ok; Warm Reject
Radioactive isotopes administered 24 hours prior to venipuncture	Reject

Specimen Stability Information

Specimen Type	Temperature	Time	Special Container
Serum	Frozen (preferred)		

	Refrigerated	72 hours	
--	--------------	----------	--

Clinical & Interpretive

Clinical Information

Type 1 diabetes, commonly referred to as insulin-dependent diabetes mellitus (IDDM), is caused by pancreatic beta-cell destruction that leads to an absolute insulin deficiency.(1) The clinical onset of diabetes does not occur until 80% to 90% of these cells have been destroyed. Prior to clinical onset, type 1 diabetes is often characterized by circulating autoantibodies against a variety of islet cell antigens, including glutamic acid decarboxylase (GAD), tyrosine phosphatase (IA2), and insulin.(2-5) The autoimmune destruction of the insulin-producing pancreatic beta cells is thought to be the primary cause of type 1 diabetes. The presence of these autoantibodies provides early evidence of autoimmune disease activity, and their measurement can be useful in assisting the physician with the prediction, diagnosis, and management of patients with diabetes. Insulin is the only beta-cell specific autoantigen thus far identified.(4-6) Antibodies to insulin are found predominantly, though not exclusively, in young children developing type 1 diabetes. In insulin-naïve (untreated) patients, the prevalence of antibodies to insulin is almost 100% in very young individuals and almost absent in adult onset of type 1 diabetes. Because the risk of diabetes is increased with the presence of each additional autoantibody marker, the positive predictive value of insulin antibody measurement is increased when measured in conjunction with antibodies to GAD and IA2.(2-4)

Performance

PDF Report

No

Day(s) Performed
Monday through Sunday

Report Available
9 to 16 days

Performing Laboratory Location
Esoterix Endocrinology

Fees & Codes

- Fees
- Authorized users can sign in to [Test Prices](#) for detailed fee information.
 - Clients without access to Test Prices can contact [Customer Service](#) 24 hours a day, seven days a week.
 - Prospective clients should contact their account representative. For assistance, contact [Customer Service](#).

Test Classification

This test was developed and its performance characteristics determined by LabCorp. It has not been cleared or approved by the Food and Drug Administration.
