

Amphetamines Confirmation, Random, Urine

Overview

Useful For

Confirming drug exposure involving amphetamines such as amphetamine and methamphetamine, phentermine, pseudoephedrine/ephedrine, methylenedioxyamphetamine (MDA), and methylenedioxymethamphetamine (MDMA)

Special Instructions

• Clinical Toxicology CPT Code Client Guidance

Method Name

Liquid Chromatography Tandem Mass Spectrometry (LC-MS/MS)

NY State Available

Yes

Specimen

Specimen Type

Urine

Ordering Guidance

For situations where chain of custody is required, a Chain of Custody Kit (T282) is available. For chain-of-custody testing, order AMPHX / Amphetamines Confirmation, Chain of Custody, Random, Urine.

Additional drug panels and specific requests are available; call 800-533-1710.

Additional Testing Requirements

If urine creatinine is required or adulteration of the specimen is suspected, the following test should also be ordered, ADULT / Adulterants Survey, Urine.

Specimen Required

Supplies: Sarstedt Aliquot Tube, 5 mL (T914) **Collection Container/Tube:** Plastic urine container **Submission Container/Tube:** Plastic, 5-mL tube

Specimen Volume: 3 mL **Collection Instructions:**

- 1. Collect a random urine specimen.
- 2. No preservative

Additional Information:

- 1. No specimen substitutions.
- STAT requests are **not accepted** for this test.

Amphetamines Confirmation, Random, Urine

3. Submitting less than 1 mL will compromise our ability to perform all necessary testing.

Forms

If not ordering electronically, complete, print, and send a <u>Therapeutics Test Request</u> (T831) with the specimen.

Specimen Minimum Volume

1.5 mL

Reject Due To

Gross	ОК
hemolysis	
Gross icterus	ОК

Specimen Stability Information

Specimen Type	Temperature	Time	Special Container
Urine	Refrigerated (preferred)	28 days	
	Ambient	28 days	
	Frozen	28 days	

Clinical & Interpretive

Clinical Information

Amphetamines are sympathomimetic amines that stimulate the central nervous system activity and, in part, suppress the appetite. Phentermine, amphetamine, and methamphetamine are prescription drugs for weight loss. All other amphetamines are Class I (distribution prohibited) compounds. In addition to their medical use as anorectic drugs, they are used in the treatment of narcolepsy, attention-deficit disorder/attention-deficit hyperactivity disorder and minimal brain dysfunction.

Because of their stimulant effects, the drugs are commonly sold illicitly and abused. Physiological symptoms associated with very high amounts of ingested amphetamine or methamphetamine include elevated blood pressure, dilated pupils, hyperthermia, convulsions, and acute amphetamine psychosis.

Reference Values

Negative

Positive results are reported with a quantitative result.

Cutoff concentrations by liquid chromatography tandem mass spectrometry:

Amphetamine: 25 ng/mL Methamphetamine: 25 ng/mL Phentermine: 25 ng/mL

Methylenedioxyamphetamine: 25 ng/mL Methylenedioxymethamphetamine: 25 ng/mL

Amphetamines Confirmation, Random, Urine

Pseudoephedrine/ephedrine: 25 ng/mL reported as negative

Interpretation

The presence of amphetamines in urine is a strong indicator that the patient has used one of these drugs within the past 3 days.

Methamphetamine has a half-life of 9 to 24 hours and is metabolized by hepatic demethylation to amphetamines. Consequently, a sample containing methamphetamine usually also contains amphetamine. Amphetamine has a half-life of 4 to 24 hours.

Amphetamine is **not** metabolized to methamphetamine; absence of methamphetamine in the presence of amphetamine indicates the primary drug of abuse is amphetamine. However, trace amounts of methamphetamine can be detected in amphetamine-based prescription drugs (eg, Adderall), but the concentrations are typically less than 1% of the amphetamine concentrations.

3,4-Methylenedioxymethamphetamine (Ecstasy, MDMA) is metabolized to 3,4-methylenedioxyamphetamine (MDA).

Methylenedioxyethylamphetamine (MDEA) is also metabolized to MDA.

The detection interval in urine for amphetamine type stimulants is typically to 3 to 5 days after last ingestion.

This test will produce true-positive results for urine specimens collected from patients who are administered Adderall and Benzedrine (contain amphetamine); Desoxyn and Vicks Inhaler (contain methamphetamine); Selegiline, and famprofazone (metabolized to methamphetamine and amphetamine); and clobenzorex, fenproporex, mefenorex, and fenethylline, which are amphetamine pro-drugs and metabolized to amphetamine.

Cautions

Over-the-counter sympathomimetics such as ephedrine and phenylpropanolamine are occasionally detected in the screening immunoassay.

Performance

Method Description

The urine sample is diluted and then analyzed by liquid chromatography tandem mass spectrometry for the presence of amphetamines. (Unpublished Mayo method)

PDF Report

No

Amphetamines Confirmation, Random, Urine

Day(s) Performed

Monday through Friday

Report Available

3 to 5 days

Specimen Retention Time

14 days

Performing Laboratory Location

Mayo Clinic Laboratories - Rochester Superior Drive

Fees & Codes

Fees

- Authorized users can sign in to <u>Test Prices</u> for detailed fee information.
- Clients without access to Test Prices can contact <u>Customer Service</u> 24 hours a day, seven days a week.
- Prospective clients should contact their account representative. For assistance, contact <u>Customer Service</u>.

Test Classification

This test was developed and its performance characteristics determined by Mayo Clinic in a manner consistent with CLIA requirements. It has not been cleared or approved by the US Food and Drug Administration.
