

Pediatric Allergy Screen <3 Years, Serum

### Overview

# **Useful For**

Establishing a diagnosis of an allergy to egg whites, milk, wheat, soybeans, and house dust mites

Defining the allergen responsible for eliciting signs and symptoms

Identifying allergens:

-Responsible for allergic response and/or anaphylactic episode

-To confirm sensitization prior to beginning immunotherapy

-To investigate the specificity of allergic reactions to insect venom allergens, drugs, or chemical allergens

#### **Profile Information**

Test Id	Reporting Name	Available Separately	Always Performed
EGG	Egg White, IgE	Yes	Yes
MILK	Milk, IgE	Yes	Yes
WHT	Wheat, IgE	Yes	Yes
SOY	Soybean, IgE	Yes	Yes
DF	House Dust Mites/D.F., IgE	Yes	Yes

#### **Special Instructions**

<u>Allergens - Immunoglobulin E (IgE) Antibodies</u>

#### Method Name

Fluorescence Enzyme Immunoassay (FEIA)

#### NY State Available

Yes

### Specimen

# Specimen Type

Serum

### **Ordering Guidance**

For a listing of allergens available for testing, see <u>Allergens - Immunoglobulin E (IgE) Antibodies</u>

## Specimen Required Collection Container/Tube:

Pediatric Allergy Screen <3 Years, Serum

Preferred: Serum gel
Acceptable: Red top
Submission Container/Tube: Plastic vial
Specimen Volume: 0.5 mL for every 5 allergens requested
Collection Instructions: Centrifuge and aliquot serum into a plastic vial.

### Forms

If not ordering electronically, complete, print, and send an <u>Allergen Test Request</u> (T236) with the specimen.

### **Specimen Minimum Volume**

For 1 allergen: 0.3 mL For more than 1 allergen: (0.05 mL x number of allergens) + 0.25 mL deadspace

#### Reject Due To

Gross	ОК
hemolysis	
Gross lipemia	ОК

### **Specimen Stability Information**

Specimen Type	Temperature	Time	Special Container
Serum	Refrigerated (preferred)	14 days	
	Frozen	90 days	

### **Clinical & Interpretive**

### **Clinical Information**

Clinical manifestations of immediate hypersensitivity (allergic) diseases are caused by the release of proinflammatory mediators (histamine, leukotrienes, and prostaglandins) from IgE-sensitized effector cells (mast cells and basophils) when cell-bound IgE antibodies interact with an allergen.

In vitro serum testing for IgE antibodies provides an indication of the immune response to allergens that may be associated with allergic disease.

The allergens chosen for testing often depend upon the age of the patient, history of allergen exposure, season of the year, and clinical manifestations. In individuals predisposed to develop allergic disease, the sequence of sensitization and clinical manifestations proceed as follows: eczema and respiratory disease (rhinitis and bronchospasm) in infants and children younger than 5 years of age due to food sensitivity (milk, egg, soy, and wheat proteins) followed by respiratory disease (rhinitis and asthma) in older children and adults due to sensitivity to inhalant allergens (dust mite, mold, and pollen inhalants).

# **Reference Values**

Pediatric Allergy Screen <3 Years, Serum

Reference values apply to all ages.

#### Interpretation

Detection of IgE antibodies in serum (class 1 or greater) indicates an increased likelihood of allergic disease as opposed to other etiologies and defines the allergens that may be responsible for eliciting signs and symptoms.

The level of IgE antibodies in serum varies directly with the concentration of IgE antibodies expressed as a class score or kU/L.

#### Cautions

Testing for IgE antibodies is not useful in patients previously treated with immunotherapy to determine if residual clinical sensitivity exists, or in patients in whom the medical management does not depend upon identification of allergen specificity.

Some individuals with clinically insignificant sensitivity to allergens may have measurable levels of IgE antibodies in serum, and test results must be interpreted in the clinical context.

False-positive results for IgE antibodies may occur in patients with markedly elevated serum IgE (>2500 kU/L) due to nonspecific binding to allergen solid phases.

#### **Clinical Reference**

#### Performance

### **Method Description**

Pediatric Allergy Screen <3 Years, Serum

Specific IgE from the patient's serum reacts with the allergen of interest, which is covalently coupled to an ImmunoCAP. After washing away nonspecific IgE, enzyme-labeled anti-IgE antibody is added to form a complex. After incubation, unbound anti-IgE is washed away, and the bound complex incubated with a developing agent. After stopping the reaction, the fluorescence of the eluate is measured. Fluorescence is proportional to the amount of specific IgE present in the patient's sample (ie, the higher the fluorescence value, the more IgE antibody is present).(Package insert: ImmunoCAP System Specific IgE FEIA. Phadia; Rev 06/2020)

# PDF Report

No

Day(s) Performed Monday through Friday

**Report Available** Same day/1 to 3 days

Specimen Retention Time 14 days

**Performing Laboratory Location** Mayo Clinic Laboratories - Rochester Superior Drive

# Fees & Codes

#### Fees

- Authorized users can sign in to <u>Test Prices</u> for detailed fee information.
- Clients without access to Test Prices can contact <u>Customer Service</u> 24 hours a day, seven days a week.
- Prospective clients should contact their account representative. For assistance, contact Customer Service.

### **Test Classification**

This test has been cleared, approved, or is exempt by the US Food and Drug Administration and is used per manufacturer's instructions. Performance characteristics were verified by Mayo Clinic in a manner consistent with CLIA requirements.

### **CPT Code Information**

86003 x 5
